AutoCAD [Mac/Win]

Geometry and drawing objects (lines, circles, polygons) used in a drawing are stored in layers. The layers can be created and deleted and, for AutoCAD 2005, named. Layers can be viewed in the Layers dialog box, and editing their properties can be done through a similar dialog box. Layers can be grouped into layers sets, which group together related layers, such as Geometry, Walls, Roofs and Floors. Layers can be in the foreground, or in the background. Background layers are typically transparent, and foreground layers are opaque. Background layers are typically transparant. They can be made transparent or opaque by dragging them into the foreground. Background layers cannot be deleted unless the drawing is modified. The display of objects is set by the Data Entry Settings dialog box. Objects can be turned on or off, by choosing the Show All option. Objects can also be coloured to indicate their material (hue), their quantity (brightness), their visibility (lightness) or their opacity (opacity). The User Interface includes a system-wide tool pallet, which contains a number of tools, including a Table of Contents tool and a Search tool. Tools can be opened and closed by clicking their icon on the tool bar, or be opened by double-clicking on their icon on the tool bar. Objects (called "entities") include shapes, lines, arcs, colors, dimension styles, guides and connectors. AutoCAD also supports text objects. The placement, text formatting and dimensions of object types can be modified using the Object Properties dialog box. Objects can be moved, copied, pasted, rotated, resized, deleted and dragged to other positions on the screen. Drawings can be saved in a number of formats, including DXF, DWG, PDF, EMF and SVG. The DXF format can be opened and read by many other CAD programs, including the FreeCAD modeling software and the FreeCAD rendering program. DXF is also the standard format for importing and exporting data from other CAD programs. The drawing and features of the individual drawings can be managed using the Drawing Manager. It allows different layers, drawings and dimensions to be grouped into folders. Dimensions can be set to automatically update when the drawing is modified.
